

- Thank you for selecting the Tracer LPLI series MPPT solar charge controller with built-in LED driver. Please read this manual carefully before using the product and pay attention to the safety information.
- \* Do not install this product in humid, salt spray, corrosion, greasy, flammable, explosive, dust accumulative, or other severe environments.

# **MPPT Solar Charge Controller**

## ---with built-in LED Driver

# 1. Safety Information

- Read all of the instructions in the manual before installation. DO NOT disassemble or attempt to repair the controller.
- Install external fast-acting fuses or breakers as required.
- Do disconnect the solar module and fast-acting fuses/ breakers near to battery before installing or moving the controller.
- Power connections must remain tight to avoid excessive heating from a loose
- Only charge batteries that comply with the controller.
- Battery connection may be wired to one battery or a bank of batteries.
- Risk of electric shock! The PV and load can produce high voltages when the controller is working.

## 2. Overview

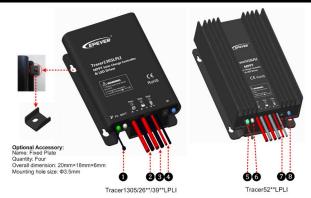

The Tracer LPLI series, MPPT solar charge controllers, combine the solar charge controller and LED constant current driver into one unit. It is ideal for solar LED Lighting, especially when the dimmer function is needed. The advanced Maximum Power Point Tracking charging methods enables the system charging and discharging management to obtain the most radical optimization. Increase the system flexibility yet lower the system cost. The features are listed below:

- Advanced Maximum Power Point Tracking (MPPT) technology, with tracking efficiency of no less than 99.5%
- Maximum conversion efficiency of 98%

- Accurately multiple power points recognizing and tracking
  Ultra-fast tracking speed and guaranteed tracking efficiency
  Adopt high-quality components of ST, IR, and Infineon to ensure product lifespan
- Apply to lead-acid battery and lithium battery
- Lithium battery self-activating function
- Lithium battery low-temperature protection function
- Charging current limit, with settable current
- Lithium battery limit current in low temperature
- Intelligent power mode with 365-day lighting control technology
- Intelligent power reduction function

  Digital precision constant current control and the control accuracy are less than ±2%
- Maximum output efficiency of 96%
- PV and Load power limitation function
- The output current can be adjusted among the rated power and current range
- Real-time energy statistics function
- Monitoring and setting parameters via Mobile APP and RC10 with IR function
- Aluminum housing for better cooling
- Wide working environment temperature(-40°C~60°C)
- IP68 waterproof degree

## 3. Product Features

1	Temperature Sensor	(5)	Charging Status LED indicator
2	PV Positive and Negative Wires	6	Battery Status LED indicator
3	Battery Positive and Negative Wires	7	Infrared Receiver Module
(4)	Load Positive and Negative Wires	(8)	Infrared LED

### 4. Wiring

#### Reference for Serial connection of LED

System Voltage	Serial connection	Min. Output Voltage	Max. Output Voltage
12V	5~18 LED	15V	60V
24V	10∼18 LED	30V	60V

NOTE: The above LED (1W. 3.3V) is calculated. If the user uses the unconventional LED, The actual LED voltage must be less than the Max. Load Output Voltage

WARNING: Risk of electric shock! With the product's built-in boost LED driver, the output voltage is higher than the human safety voltage.

#### Connection Order

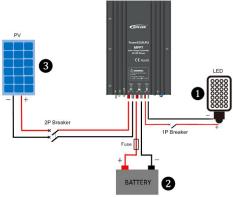

1) Connect components to the charge controller in the sequence as shown above and pay much attention to the "+" and "-." Please don't insert the fast-acting fuse or turn on the breaker during the installation. When disconnecting the system, the order will be

#### reserved

- 2) After powering on the controller, check the battery LED indicator on the controller; it will be green. If it's not green, please refer to chapter 9.
- 3) Connecting a fast-acting fuse in series through battery positive (+) in the circuit and the battery circuit fast-acting fuse must be 1.25 to 2 times the rated current. The installed distance is within 150mm.

NOTE: The controller can only charge or discharge alone but can carry out the discharge process to check the load preferentially.

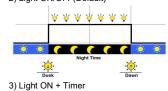

#### Load self-test function

The load is ON when the controller is powered on for 10 seconds. After 10 seconds, it restores to set working mode.

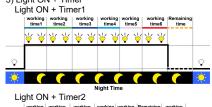

5. LED Indicators								
Indicator	Color	Status	Instruction					
PV	Green	On Solid	PV connection normal but low voltage(irradiance) from PV, no charging					
	Green	OFF	No PV voltage(night time) or PV connection problem					
	Green	Slowly Flashing(1Hz)	In charging					
	Green	Fast Flashing(4Hz)	PV Over voltage					
	Green	On Solid	Normal					
BATT	Green	Slowly Flashing(1Hz)	Full					
-2000 DAS	Green	Fast Flashing(4Hz)	Overvoltage					
	Orange	On Solid	Under voltage					
	Red	On Solid	Over discharged Low temperature					
	Red	Fast Flashing(4Hz)	Battery Overheating					
Charging indic	ator(green) a	Set parameters						
indicator(orang	je) flash twic	successfully						
Charging indicindicator(orang		System voltage error※						

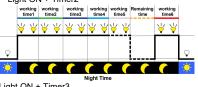

\* When the battery type is a lithium battery, the controller cannot recognize the system voltage automatically.

Turn-On voltage (Adjustable): 5V (12Vsystem), delay10min. Turn-Off voltage (Adjustable): 6V (12Vsystem), delay10min. Note: 24V system voltage×2

	Night Time								

4) Real-time Control

Control the load ON/OFF by setting a real-time clock.

5) Intelligent Power Reduction Mode

When the battery voltage goes lower than the "Reduce Power Start Voltage (adjustable)," the intelligent power reduction mode is enabled. The LED output current is automatically reduced linearly with the battery's voltage drop. When the battery voltage goes lower than the "Reduce Power End Voltage (adjustable)," the LED output current is 2% of the rated load current. The minimum percentage can be set to 1%. Also, when

the battery voltage exceeds "Reduce Power Start Voltage," the controller exits the intelligent power reduction mode.

NOTE: In Light ON/OFF and Light ON/Timer mode, the load is turned on after a

1-minute delay (the delay time can be set).

# 7. Setting Operation

There are three methods that it can realize controller load modes and parameters through IR function:

1) IR Remote Control—RC10

2) Super Parameter Programmer—FC-01

This method can realize one-key setting operation which is suitable for bulk quantity products setting or applied in the projects.

3) Mobile APP+eBox-WIFI&IR-01/02

Real-time monitoring and setting the parameters

Note: Please refer to the user manual of handheld device

Load Short Circuit  Load Short Circuit, the output is OFF 5s. Second short circuit, the output is OFF 10s. Third short circuit, the output is OFF 15s. Fourth short circuit, the output is OFF 20s. Fifth short circuit, the output is OFF 25s. Sixth short circuit, the output is OFF.  Clear the fault: Restart the controller or wait for one night-day cycle (night time>3 hours).		gradually from T4 to T1, it is performed at I4.
	 First short circuit, the output is OFF 5s. Second short circuit, the output is OFF 10s. Third short circuit, the output is OFF 15s. Fourth short circuit, the output is OFF 20s. 9. Troubleshooting							
Faults	Possible reasons	Troubleshooting					
LED charging indicator turn off during daytime when sunshine falls on PV modules properly	PV array disconnection	Confirm that PV and battery wire connections are correct and tight					
No LED indicator	Battery voltage may be less than 8.5V	Measure battery voltage with the multi-meter. Min.8.5V can start up the controller					
Battery LED indicator green fast Flashing	Battery over voltage	Check if the battery voltage is higher than OVD, and disconnect the PV					
Battery LED indicator red	Battery over discharged <sup>①</sup>	When the battery voltage is restored to or above the LVR point (low voltage reconnect voltage), the load will recover					
Battery LED indicator red Flashing	Battery Overheating	The controller will automatically turn the system off. But while the temperature declines below 50°C, the controller resumes.					
Powering on normally, the load is off	①The connecting wires are error or virtually connected ②Load mode is not appropriate. ③This controller does not match the LED light. ④Output short circuit.	Check the connecting cable.     Check the load's mode and parameters.     The voltage of the LED light is not within the output voltage range of the controller.     Check the connecting cables and LED light.					
The dimming function is invalid	The controller does not match the LED light source. This product is step-up voltage control. If the input voltage is lower than the rated voltage, it is not working.	①Replace the LED light ②Reduce the rated voltage grade and replace the product model For example, changes the 24V system to a 12V system and replace the corresponding controller					

①After the battery is over-discharged, the battery indicator is still red, and the load is off all the time until the voltage is lower than the Low Voltage Reconnect Voltage (LVR). To judge whether the system is normal or not, firstly, measure whether the battery voltage is higher than the LVR; if not, restart the controller to detect whether the load is normal.

NOTE: The LVR can be set, but you must pay more attention to modifying it. Or, the battery may be damaged if the LVR is too low.

8. Protection							
Protection	Conditions	Status					
PV Reverse Polarity	The PV can be reversely connected with a controller when:  ✓ Only the PV connects with the controller;  ✓ The battery is positively connected, and the open-circuit voltage of the PV is lower than 85V (This requirement is only for Tracer26/39/5210LPLI).	The controller is not damaged					
Battery Reverse Polarity	The battery can be reversed when the PV is not connecting or the connection is reversed.  WARNING: The controller will be damaged when the PV connection is correct while the battery connection is reversed!	•					
Battery Over Voltage	The battery voltage reaches the OVD	Stop charging					
Battery Over Discharge	The battery voltage reaches the LVD	stop discharging					
Battery	The temperature sensor is higher than 65°C	Output is OFF					
Overheating	The temperature sensor is less than 55℃	Output is ON					
Lithium battery Low	The temperature sensor is less than the low-temperature value	Lithium battery stops charging					
Temperature (Default 35℃)	The temperature sensor is higher than the low-temperature value	Lithium battery charging					
Lithium battery limit current in low temperature	Limit current temperature T1>T2>T3>T4>T5>T6 Limit current I1>I2>I3>I4>I5>I6	When the temperature is lower than T1, the charging current is I1; when the temperature is lower than T2, the charging current is I2, and so on. However, when the temperature rises

The controller has the charge current limit function. The charge current can be set via the app and remote controller.
